COMPUTER AND TEACHER

CAN COMPUTER REPLACE TEACHERS AT SCHOOL?

School is an institution where students learn. There are a lot of teachers who are charged to inculcate course and teach tomorrow generations. Nonetheless, the problem is technology has influenced students tremendously. So can computers replace teachers?

Technology has become an important tool in the students' life: computer, phone, TV, Ipad, IPhone, to name, but a few. The first device makes studies easier than it used to be. Students have been using computers all time. What about the role of teachers? The answer is very easy. They will have a very crucial place at school. In my opinion, computers can't replace teachers because some subjects need more explanation as Math. In this situation computers aren't enough. Expect that students are very intelligent. Furthermore, teachers don't give just lesson. They have been breeding students and socialize them. For example if students choose to be educated by computes they will not have any relation among themselves. They will be alone, because in a part these machines have negative effects. They prohibit students from creating relationship between them. It takes a lot of time students. They else sanction students from generating good relationships among parents and students. Despite all these negatives, these apparatuses have positive effects as facilitating search. They cater for a lot of exercises better than some teachers... the most important thing is that teachers are badly needed together with the help of computers.

Finally I want to say that both computers and teachers play an important role in a student's life. Teachers teach, educate, and communicate ..., Computers are for conducting searches. But students shouldn't depend definitely on computers because they may dismiss their studies. But I think that they will not terminate their relationship with their environment.
